Cell Culture

RBL2 Baseline

- Healthy
- Use for EC50
  - Seed tomorrow based on results
- Split 1/4
- Would like to discontiue the line once we have firmly established optimal dose-response conditions for RTX

RBL2 RTX-Treated

- Cells look rough
- Spun down and resuspend in 12 well plates
- Expanded too quickly

RBL2 Control

- Look good
- Leave for another day

EC50_250407 Collection - RBL2 RTX CDC Baseline

- Collected plates seeded on 07-04-2025
- EC Plate collection protocol:
  1. Added 20μL Cell Titre Blue (CTB) to each conditioned well
  - 20μL CTB/100μL of conditioned well recommended by manufacturer
  2. Incubated for 2hr at 37C
  3. Read on plate reader according to Cell Titre Blue Protocol

Results:

- Seeding conditions seem to be optimized
  - HIAS conditions seem weird
    1. Seems to be due to seeding error in the first row
  - RTX+/NHS+ pushed down to acceptable levels at highest dose
    1. Could potentially go higher? (100ug/mL??)
    2. Would prefer to limit to 20ug/mL for resource maintenance

RTX EC50_250421 RBL2 - Seeding

- Seeded an EC50 experiment comparing the effects of RTX on Baseline RBL2 in the presence of 25% NHS or 25% HIAS
  - Looking to establish optimal EC50 range
- Seeded 1 plates with the RBL2 Baseline population based on previous results:
  - 40k cells per well
  - Starting at 100ug/mL dose
- Used Rixathon (Catalogue#:)

Plate seeding protocol:

1. Diluted cell suspension to seed 40000 cells/well in 50μL amounts

- Seeding was incorrect

Plate	Cell Line	Cell Count	Required Cell total	Required Volume total	CS cells/mL	Stock Volume (uL)	Media Volume (mL)
Plate 1	RBL2	2.80×10^6	3.20×10^6	4	8.00×10^5	1142.8	2.8572

2. Made RTX dilutions and added to respective wells in 25μL
   - [RTX stock] = 10.3 mg/mL
   - Drug volumes are added in triplicate
   - Drug volumes are being added consititute 1/4 of well volume:
     - [RTX working] needs to be 4x [RTX well]
       - 6 wells per condition, 25μL per well ~ minimum of 150μL per condition needed (recommend 200μL) ** Incorrect dosing

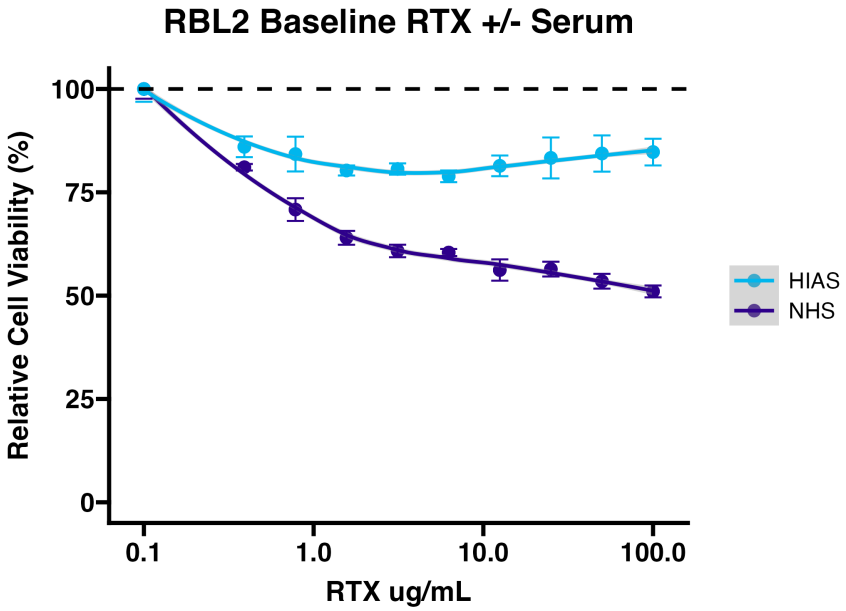
Results:

- Seeding error
  - Seeded incorrect number of cells (undercounted - overseeded)
  - HIAS condition is lower than ideal
    1. Seeding error?
    2. HIAS quality?
  - Still struggling to crack 50% Cell viability reduction
    1. In this case likely due to seeding
    2. EC50_250422 looks similar however
    3. Seed less cells?



- Conclusions:
  - 40k might be too much
    1. Seed 20k on top and 30k on bottom?
    2. Thaw new cells
